

The user will have a unique tool for the organization and cataloging video files, songs, clips, commercial, programs and shows.

**Philo** also allows contextual management of audio files with videos or matched images.

With the same logic you will be able to plan generic events or linked to individual files, such as graphic display, banner or logos, or command to external devices.

**Philo** can manage multiple channels, giving the possibility, if desired, to share resources in common spaces.

Creating playlist is easy and intuitive and can be managed at different levels, from manual, very simple with the drag and drop of single elements or entire programming blocks, to fully automatic.

Parametric programming gives the user the ability to control the timing and mode of repetition of songs and artists.

**Philo** includes a basic advertising planning tool.

The software is multilingual, name and required fields are customizable.

## SYSTEM REQUIREMENTS PLAYOUT

### Minimum

CPU Pentium i5, 8 GB RAM

### Suggested

CPU Pentium i7, 8 GB RAM, AMD or NVIDIA Graphics Card

### Supported Operating Systems

Windows 7, Windows 8, Windows 10
